Index

Important safety instructions:

General installation conditions:

- Before handling or connecting the equipment, please read this manual.
- Do not obstruct the equipment's ventilation system.
- Please allow air circulation around the equipment.
- Do not place the equipment near sources of heat or in excessively moisture conditions.
- Do not place the equipment where it may be affected by strong vibrations or knocks.

How to use the equipment safely:

- If any liquid or object falls inside the equipment, please contact a specialized technician.
- Do not connect the equipment until all the other connections have been made.

Instructions for the optical connection:

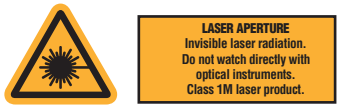
- For the optical connection, a single mode fibre cable is used with an SC/APC-type connector.
- Remove the dust cap from the optical connector located on the front panel, as well as the one of the connector of the single mode fiber to be connected to the equipment.
- Connect the cable to the device, carefully slotting the guides together for both connectors, pushing the connector all the way in.

Precautionary measures with the connection point:

- Take special care to avoid damaging the unprotected ends of the connectors, as small scratches, impurities and/or particles of dirt, oil, grease, sweat etc. may significantly affect the quality of the signal.
- To clean the ends of the connectors, wipe with an appropriate cleaning wipe moistened with isopropyl alcohol, specific for the cleaning of optical elements. Make sure the alcohol evaporates fully before connecting.
- Keep the connector covers and cable caps in a safe place in case they are needed in the future.
- Always fit the covers on the connectors of devices that are not connected to cables to prevent the laser beam from damaging the eyes.
- Avoid turning on the transmitter without having the fibre optic cable connected.

Safety measures

Warning.-
This product emits an invisible laser beam. Avoid contact with laser radiation. The use of equipment such as binoculars or magnifying glasses may increase damage caused to the eyes.



According to EN60825-1_ 2007

Caution

- The use of controls or adjustments, or procedures other than those specified in this manual may result in exposure of body parts to harmful radiation.
- Carefully read and observe the instructions given in this manual, and keep it for future reference.
- Do not use the equipment in any way that does not comply with the operating instructions or in any conditions that exceed the stipulated atmospheric specifications.
- This equipment is not user-serviceable. Should you require assistance, contact our technical service department.
- Never point the laser beam intentionally at people or animals.

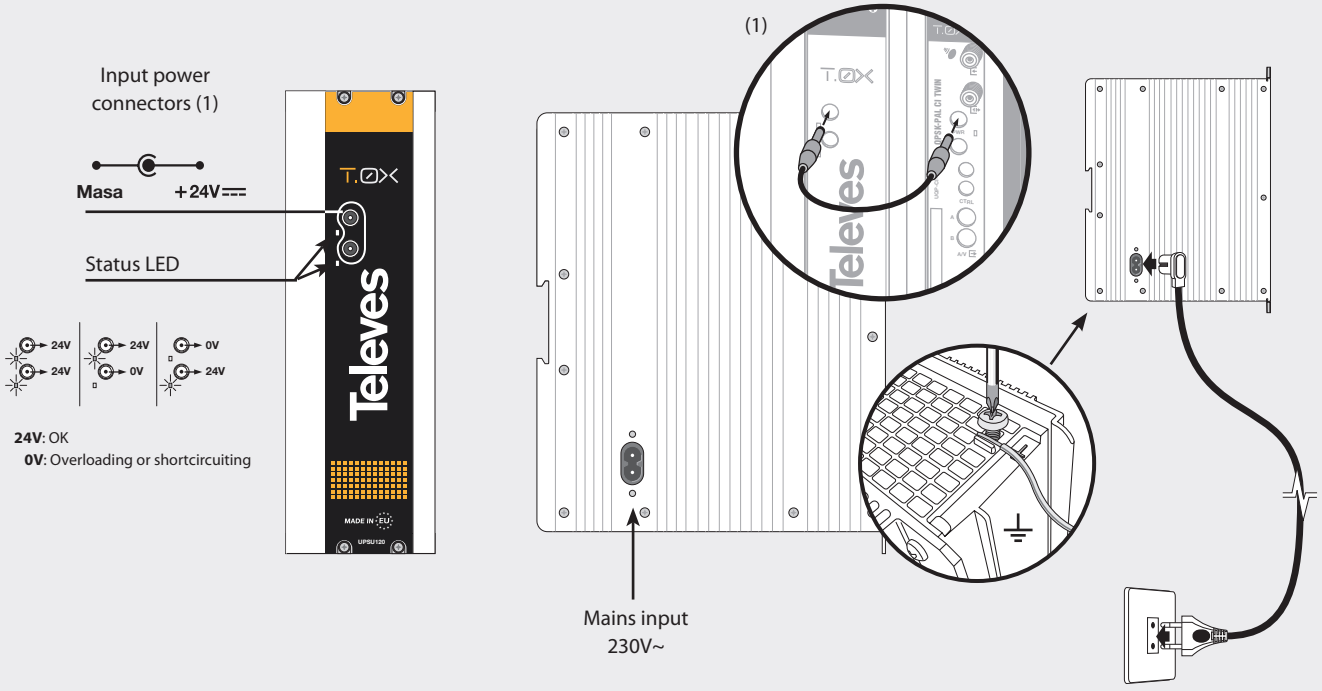
4.3. Power Supply Unit



NOTE: You must use both outputs of the source when consumption exceeds 4 amps on either of them (maximum current for each output)

5. Examples of application

Correct use of the devices.

There are several basic concepts that should not be forgotten. The technical specifications are a set of maximums to be handled with some care.

To calculate the RF level which must excite the transmitter, use the data in the table shown below and the following formulas:

EIN= EINn +10×log(BW) [1]
C/N=Vin - EIN [2]

where:

- **EIN** is the equivalent input noise. That is, the noise in RF, which would have to be present at the input of the transmitter in an ideal optic system that did not add noise, so as to obtain the same level of noise at the output of the receiver of the real system (It always add noise).
- **EINn** is the EIN for a bandwidth of 1Hz.
- **BW** is the bandwidth of the RF signal.
- **Vin** is the RF input level, and is given in dBm.

Here are some examples.

Opt. Link atenuattion (dB)	Gain at 870 MHz (dB)	EINn (dBm/Hz)	Gain at 1.5 GHz (dB)	EINn (dBm/Hz)	Gain at 2.15 GHz (dB)	EINn (dBm/Hz)

16.5	-16.3	-123.8	-15.5	-124.8	-15.3	-126.3
17	-17.3	-122.8	-16.5	-123.8	-16.3	-125.4

Measurements made with a transmitter that delivers 6.1 dBm, followed by a reel of fiber of 5 km long and an optical attenuator connected between the end of the reel of fiber and optical receiver input.

Example 1

Calculate the C / N at the output of the optical receiver (C/N of the link), in the installation of the figure below:

This is a link where the optical signal is split between 4 fibers of 1 km, using a splitter ref. 2339. The signal received at the other end is converted back to RF by means of the optical receiver ref. 2335.

The channel levels that excite the transmitter are:

- 83 dBµV (-26 dBm 42CH CENELEC) ***analog channels,*** *TV band.*

- 73 dBµV (-36 dBm) ***digitales channels,*** *SAT band.*

Analog terrestrial channel bandwidth: *5 MHz*

Satellite digital transponder bandwidth: *27 MHz*

On the other hand:

- 1 km optical fiber is equivalent to 0.4 dB of attenuation.
- The splitter features 6.8 dB loss.
- The 2 fiber optic connectors represent 0.8 dB (2 × 0.4).

Therefore, total losses of the optical fiber link are:

FO losses+Optical splitter losses+Connectors losses

This is: 0.4 + 6.8 + 0.8 = 8 dB

Now we use the formulas and data given in the table above.

For the TV band, we consider the column of the *Gain at 807 MHz.* This column intersects with the row of 8 dB of loss calculated for the optical fiber link in the value of 0.6 dB, which would correspond EINn =-139.9 dB/Hz.

Apply the formula [1] and we obtain:

EIN_{TV}= -139.9 + 10×log(5×10^6)= -72.91 dBm

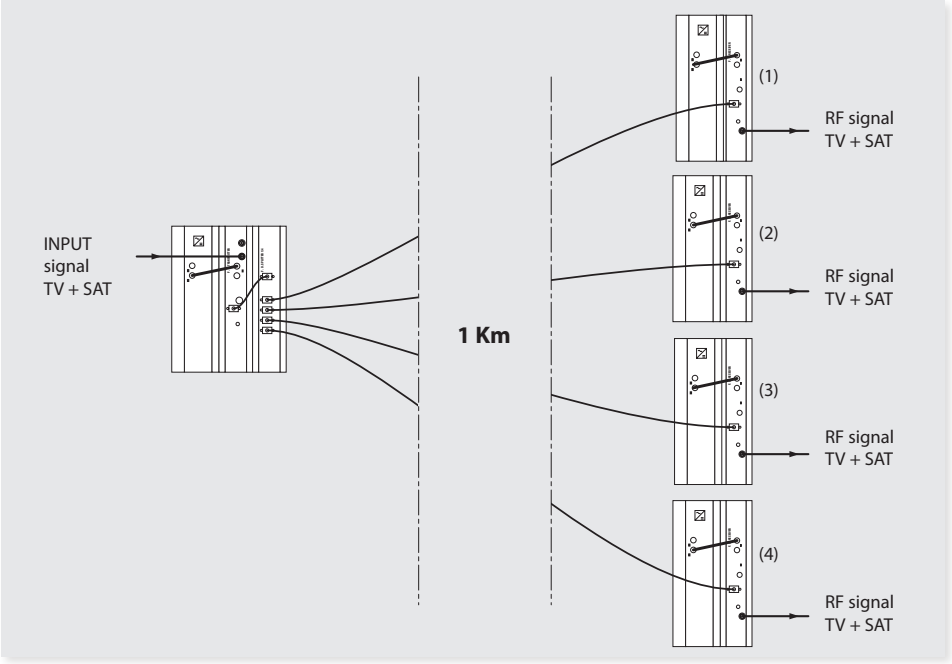
Now apply the formula [2] to calculate the C/N, as follows:

C/N_{TV}=Vin - EIN_{TV}

C/N_{TV} = -26 dBm -(- 72.9 dBm) = -26+72.9

Then, **C/N_{TV} = 46.9 dB**

In practice, having satellite channels, simultaneously with the TV ones, makes the latter worse their C/N in 1 dB.



Now we do the calculation for digital satellite channels, following the same process above, but by looking at the column *Gain at 2 .1 GHz* of the table (band in which are delivered digital channels) and the following results :

EINn= -140.8 dB/Hz

$EIN_{SAT} = -140.8 + 10\times\log(27\times10^6) = -65.7$ dBm

As the input level is -36 dBm, C/N is:

$C/N_{SAT} = -36-(-65.7) = -36 + 65.7$

$C/N_{SAT} = 29.7$ dB

Example 2

Let's repeat the example above but applied to an installation with a 32 output optical splitter. The channels will be **digital only**.

Thus, the TV channels will be COFDM channels with a **$C/N_{COFDM} = 23$ dB.**

SAT channels will be DVB-S2, with a **$C/N_{DVBS2} = 14$ dB.**

The **level of excitation** of the transmitter will be the same for TV and SAT: **79 dBµV** (-30dBm).

The bandwidth will be now:

For COFDM: BW = 8×10^6 Hz (8 MHz)

For SAT: BW = 27×10^6 Hz (27 MHz)

As in Example 1, the attenuations are:

- 1 km of fiber is 0.4 dB.
- The 32 output optical splitter represents about 16 dB
- The 2 fiber optic connectors represent 0.8 dB.

Therefore, the total losses of the fiber optics are:

0.4 + 16 + 0.8 = 17.2 dB

(let's take 17 dB for this case, maximum value shown in the table)

The table provides the following information:

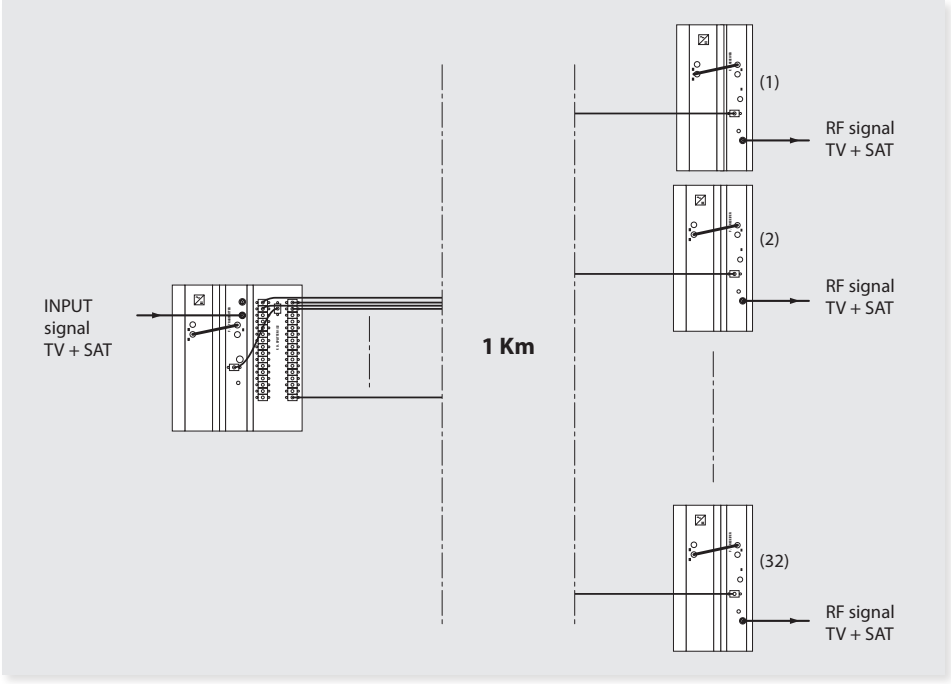
For the TV band, in the column *Gain at 807 MHz*

EINn (TV)= -122.8 dBm/Hz

G(807 MHz)= -17.3 dB

And for SAT band, look in the *Gain at 2.1 GHz* column.

EINn(SAT) = -125.4 dBm/Hz



EN

G(2.1 GHz)= -16.3 dB

Therefore, the RF signal level delivered by the receiver is:

$Vout_{rcvr}$ (dBµV) = Vin_{xmtr} (dBµV) + G (dB)

This is:

$V_{out\ rcvr\ TERR}$ (dBµV) = 79 -17.3 = 61.7 dBµV

$V_{out\ rcvr\ SAT}$ (dBµV) = 79 -16.3 = 62.7 dBµV

Applying the formula [1]:

$EIN_{TV} = EINn(TV) + 10 \times \log(8 \times 10^6)$ [dBm]

$EIN_{TV} = -122.8 + 69$

$EIN_{TV} = -53.8$ dBm

And by the formula [2] is obtained:

C/N_{TV}= - 30 dBm - (- 53.8 dBm) = **23.8 dB en TV**

Likewise, we calculate the C/N for SAT channels, resulting in:

EIN_{SAT}= - 51.1 dBm

C/N_{SAT}= -30 - (-51.1) = **21.1 dB en SAT**

If we estimate the value of the C / N for TV very tight, you can increase the excitement level of the transmitter a couple of dB, since there is enough margin before the system begins to distort.

RETURN CHANNEL

For the return channel transmitter, the table of attenuations, link gain and equivalent noise is:

Link attenuation (dB)	Gain at 30 MHz (dB)	EINn (dBm/Hz)
0	23	-152.5
3	16.6	-149.5
4	14.6	-147.6
5	12.7	-145.7
6	10.7	-143.9
7	8.7	-141.9
8	6.7	-140
9	4.7	-138.1
10	2.6	-136
11	0.4	-133.4
12	-1.5	-132
13	-3.5	-130.5
14	-5.5	-128.5

Measurements made with a transmitter that delivers 2.9dBm followed by an optical attenuator connected between the transmitter and the optical receiver.

Use the formulas 1 and 2 for making calculations. The calculation process is the same as in the case of the forward channel.

Measurements made with a transmitter that delivers 10 dBm, followed by a reel of fiber of 5 km long and an optical attenuator connected between the end of the reel of fiber and optical receiver input.

Guarantee

Televés S.A. offers a two year guarantee, beginning from the date of purchase for countries in the EU. For countries that are not part of the EU, the legal guarantee that is in force at the time of purchase is applied. Keep the purchase invoice to determine this date.

During the guarantee period, Televés S.A. complies with the guarantee by repairing or substituting the faulty equipment.

The harm produced by improper usage, wear and tear, manipulation by a third party, catastrophes or any other cause beyond the control of Televés S.A. is not included in the guarantee.
